Black and decker string trimmer replacement spool cap

A walk behind string trimmer is a gardening tool that works more or less like a lawnmower. It is able to cut through shrubs and brush easily. One significant difference between the two gadgets is the cutting elements. While the lawnmower uses a blade, the string trimmer uses a string of a particular diameter to cut through grass and small plants. Most of these devices are not self-propelling; hence they need you to walk behind and push them forward. Benefits of walk-behind string trimmers If you decide to pick these tools over regular lawn mowers, then you will likely know about the benefits. For one, these gadgets are safer than their counterparts. Lawnmowers use blades to cut grass, which are just as capable of cutting through skin and bones as well. Should an accident happen, the lawnmower will definitely cause more damage to your body. You needn't worry about that with a string trimmer. Replacing the strings should also be easier than replacing blades. Additionally, it should be cheaper. This is because strings are as well easily accessible from various vendors. Walk-behind string trimmers also often have offset decks. This makes it easier to reach some tight spaces. As well they are able to cut close to various buildings as well as around obstacles. Things to consider before buying a walk behind string trimmer In addition to the benefits of each model, there are a couple of things you need to consider before making your selection and consequent purchase. This is because different models will be suited to different users. Of course, given that we are trying to make your work easier most of the things you need to consider are listed below. How big is the area you are going to cover You don't often find string trimmer machines designed with a specific lawn size in mind. Nevertheless, if you are going to use it on a relatively large area, you will want a more powerful engine. This is because it can get the job done much faster and easier. On the other hand, it's not the best financial decision to buy top of the line products for a small piece of lawn. A device that costs half as much will still get the job done. Kind of the area you are going to work in There are walk behind string trimmer machines that are suited to open grounds. Others are more suited to working around barriers such as trees, statues, ponds, and fences. One example of such is the Southland Outdoor Power Equipment SWSTM4317 due to its head swivel. As such, you would do well to study the area you are going to work in and select the appropriate equipment for it. Who is going to do the trimming The person to do the trimming should also be a key focus area concerning the purchase. This is often in regards to the controls of the device. As such, controls that are closer to the engine should be no problem for a young, healthy person. They can bend over and adjust them accordingly. On the other hand, if the user is older, bending may present a problem. As such, it would be a better decision to spend the extra money and get a tool with controls closer to the top. Storage Of course, the device is not going to spend all of its time in your backyard. It will need a shelter away from the elements while it is not in use. This may be in your shed or even garage. More significant devices will take up more space. The handle may exacerbate this problem as well if it doesn't fold down. Price If you want to purchase any piece of equipment, you need to set aside some money. How much you set aside is dependent on your income as well as recurrent expenditure and constitutes your budget. Of course, some of the devices you encounter will fit within your budget while some won't. If you find that the machine you want costs much more than you have, you can change it up for a lower-end model. Alternatively, you can save up more money for the purchase. Features to consider when purchasing a walk behind string trimmer The features that make up each device will constitute its overall value. They are also likely to influence how well the tool performs when you put it on your grass. Since features are also part of the decision, we have provided in-depth information on them below. Engine Of course, the engine is one of the more essential aspects of the device. Just by looking at the specs, you can tell if it is powerful enough for the job at hand. Of course, some of the engines in the market will provide more torque. Others have the advantage of using up less fuel. Also, it is not surprising to find that different types of engines use different types of fuel. Two of the more common types of engines you find on walk behind string trimmers are the 2-stroke and 4-stroke options. The 2-stroke engine generally tends to be lighter since it has fewer components. It is also seemingly more efficient in its energy production process. With regards to the stroke, it can be defined as movement from the top dead center of the cylinder to the bottom dead center. It could also be the movement from the bottom dead center back to the top dead center. As such movement up and down should be considered as two strokes. In a two-stroke engine, that is enough to complete the power production cycle. If you know the cycle, then you know the steps involved. They include intake where fuel and air come into the cylinder. The next step is the compression of the gases and fuel, which is then followed by combustion. A spark plug is necessary for the combustion process to start; hence is included in the cylinder. Lastly, you get the exhaust stage where the smoke from the combusted fuel and gas is let out of the cylinder. As mentioned before, a 2-stroke engine can pull off all these steps in a single up and down motion hence the name. On the other hand, the 4-stroke engine needs two cycles of the same to pull off the same power production cycle. You will have to pick out one of these two based on the power they produce as well as how they affect the design of the machine. Another thing that matters is the type of fuel that the device uses. Oil and gas are the two main options to pick from. Of course, each option has advantages of its own, and it may come down to personal preferences. What we advise is that you go for the gas option if it is available. It constitutes cleaner energy production without giving up much power. Engine start Most of these trimmer devices come with a manual start mechanism or, as it is more aptly named the recoil start. They are inexpensive but will require you expend some of your energy to start the machine. They are also more reliable. Cutting width and height As shown in the list above, the most common cutting width is 22". Nevertheless, there are exceptions such as the Southland Outdoor Power Equipment SWSTM4317 with a 17" cutting swath. Also, most devices come with a variable cutting height. You can thus move the trimmer up or down depending on your cutting needs at the time. A prime example of this is the EARTHQUAKE M205 that can cut from 0.15" up to 3.0". However, there are exceptions in this scenario, as well. An example is the Southland Outdoor Power Equipment SWFT15022. Trimming line The thicker the line, the more durable it is. As such thick lines can handle dense and thick plants with relative ease. They will also take longer to wear out. Nevertheless, most of these walk behind string trimmers will dictate the diameter of the string you can use. If you check on the list provided, you will see that almost all the devices mentioned will allow for a 0.155" line diameter. The Southland Outdoor Power Equipment SWSTM4317 stands out since it provides for two string diameters, which are the 0.95" and the 0.105" options. Wheels Bigger is not always better, but in the case of walk-behind string trimmers, go for the machine with the most prominent wheels you can get. 12" is the baseline as it will still allow you to glide over different terrain with relative ease. Handlebar Not many people consider the handlebars of these devices as deal breakers in whether they buy the devices or not. Nevertheless, some of them provide extra benefits and are easier to work with. An example of such is in whether the handlebar has any foam or comfort material. If it is included, it will be more comfortable to hold and use the machine for extended periods. Conversely, you can purchase a pair of comfortable gloves if it doesn't. Also, how close are the controls to the handlebar? This will tell you how easy it is to change the torque without letting go of the bar. Dimensions and weight Lightweight devices are more comfortable to lift and carry around if you ever need to transport them to a different location. Also, they tend to be smaller in stature. You may also appreciate the fact that they take up less storage space. However, this may not be ideal as the small size may eat into the functionality of the invention. You can see this in how the small stature of the Southland Outdoor Power Equipment SWSTM4317 eats into the cutting area. Warranty If you are looking to own one of these tools for the long term, an extended warranty is probably a good idea. The five-year warranty provided by the EARTHQUAKE M205, for instance, is ideal. However, you should know most manufacturers will offer less than that. Other features You may still be left with more than one item in your shortlist after considering all the features above. You can break the tie by bringing in any extra features that the devices may have. Examples of such include the CARB certification provided for Outhland Outdoor Power Equipment SWFT15022 model.
